**Abstract:**

**Purpose:** Evaluation of patients' ease of use of the redesigned, disposable, ready-to-use follitropin alfa pen during controlled ovarian stimulation for assisted reproductive technology (ART).

**Methods:** This single-center, observational, open-label, single-arm study recruited infertile normo-ovulatory women (18–45 years). Nurses trained patients to self-administer recombinant human follicle-stimulating hormone (r-hFSH) daily using the follitropin alfa pen (300 IU, 450 IU, and 900 IU). Before treatment, patients completed Questionnaire A. Following self-administered treatment, on stimulation days 5–6 and 7–8 (within a day of recombinant human chorionic gonadotropin [r-hCG]), patients completed Questionnaire B. Nurses completed an ease-of-learning/teaching questionnaire. Primary endpoint: proportion of patients rating the pen as 'easy/very easy' to use (Questionnaire B) on final visit before r-hCG. Secondary endpoints included: proportion of patients rating the follitropin alfa pen as easy to learn, use, prepare, deliver, and dispose of (Questionnaires A and B). Proportions (95% confidence intervals [CIs]) were provided for primary/secondary endpoints. Adverse events were reported descriptively.

**Results:** Eighty-six patients received r-hFSH. Of the 72 patients who had completed the overall assessment questions, 66 (91.7% [95% CI 82.7–96.9]) found the pen 'easy' to use. Also, 70/86 (81.4%) patients 'strongly agreed/agreed' that, overall, it was easy to learn how to use the pen; 72/86 (83.7%) 'strongly agreed/agreed' that easily understandable, verbal information was provided; and 70/86 (81.4%) were confident about using the pen correctly. In total, 24/26 (92.3% [95% CI 74.9–99.1]) nurses rated the pen as easy to use. Clinical pregnancy rate/patient/cycle/embryo transfer was 37%. Twenty-six ovarian hyperstimulation syndrome events were reported (none severe; 16 [19%] patients); of these, 13 occurred at embryo transfer.

**Conclusion:** In this observational study, patients had a high acceptance of the redesigned follitropin alfa pen, with most finding it very easy/easy to use. ART nurses found the pen very easy/easy to teach.

**Keywords:** controlled ovarian stimulation, ease of learning, ease of teaching, prefilled pen, questionnaire, self-injection

## Introduction

Controlled ovarian stimulation (COS) using gonadotropins is a key component of assisted reproductive technology (ART).<sup>1</sup> During COS, daily injections of recombinant human follicle-stimulating hormone (r-hFSH) result in exogenous FSH levels being maintained above the threshold for follicle development for several days, and this allows multiple follicles to develop and multiple oocytes to be retrieved.<sup>2</sup> Individual responses to COS are highly variable,<sup>3,4</sup> and an excessive response is associated with the rare and potentially life-threatening condition ovarian hyperstimulation syndrome (OHSS).<sup>5</sup> As individual patient responses to COS vary, the starting dose of r-hFSH required by patients should be individualized.<sup>3,5</sup> There may also be a need to adjust the r-hFSH dose used for a particular patient once treatment has started.

In the past, FSH was available as a lyophilized formulation in glass ampoules or vials and was administered subcutaneously using syringes.<sup>6,7</sup> These conventional delivery systems were designed for administration by a healthcare professional, friend or family member, or could be self-administered. The option of self-administration has the key advantages of convenience and self-sufficiency, with women requiring fewer clinic visits.<sup>7</sup>

To enable easier and more convenient self-administration, liquid formulations of r-hFSH have been developed for administration using pen devices, such as follitropin alfa and follitropin beta.<sup>6</sup> In a prospective, open-label study, women found using a prefilled pen for r-hFSH self-administration during ovulation induction (OI) less stressful and easier to use than conventional ampoules plus syringe.<sup>8</sup> Furthermore, in a prospective, open-label survey, markedly more women (undergoing OI or ART) expressed a preference for a pen injection device over a needle-free reconstitution and conventional syringe.<sup>9</sup> Also, in a randomized, open-label study, women (undergoing COS for ART) found that, compared with a conventional syringe, self-injection with a pen device was easier, less painful, and more convenient.<sup>7</sup>

The follitropin alfa pen (GONAL-f® Prefilled Pen, Merck Serono SA Geneva, Switzerland, a subsidiary of Merck KGaA, Darmstadt, Germany) is a redesigned, disposable, ready-to-use pen containing follitropin alfa for injection, and is designed for subcutaneous self-administration by women undergoing COS for ART. The redesigned follitropin alfa pen has a number of features that

the 'original' pen does not: for example, small dose increments of 12.5 IU. The primary objective of the present study was to evaluate Australian patients' perceptions of the ease of use of the redesigned r-hFSH (follitropin alfa) pen. Other objectives included evaluations of function, reliability, ease of teaching and learning with the r-hFSH (follitropin alfa) pen, and to assess healthcare providers' perceptions of the ease of use of the pen.

## **Material and methods**

### ***Study design***

This was a single-center, observational (non-interventional), Phase IV, open-label, single-arm study in ART (Merck Serono identification number: EMR 700623-529; Merck Serono protocol number: RH090). Three clinic sites were involved (Bondi Junction, Greenwich and Westmead; New South Wales, Australia); however, as these clinics are part of the same center (IVFAustralia, Sydney, New South Wales, Australia) and use the same guidelines for protocols and procedures, this was considered to be a single-center study.

The study was conducted in accordance with the ethical principles stated in the Declaration of Helsinki and the National Health and Medical Research Council statement. The study protocol was approved by the independent ethics committee (IVFAustralia Human Research and Ethics Committee). Written, informed consent was obtained from patients prior to study start.

A study monitor visited the study sites regularly as part of the data quality assurance procedures.

### ***Patients***

Normo-ovulatory women aged between 18 and 45 years undergoing a first, second, third, or fourth cycle of ART with an indication for *in vitro* fertilization (IVF) or intracytoplasmic sperm injection

(ICSI) were recruited. Patients were required to have a regular, spontaneous menstrual cycle of 21–35 days, both ovaries, a normal uterus, a body mass index (BMI) of <30 kg/m<sup>2</sup> and an early follicular phase (cycle days 2–4) serum FSH level of ≤20 IU/L. A further inclusion criterion was availability of normal sperm (or previously obtained through surgical procedures), adequate for performing IVF or ICSI according to the center’s standard criteria.

Key exclusion criteria included: anti-Müllerian hormone (AMH) level >40 pmol/L in the 6 months prior to study treatment; previous severe OHSS; polycystic ovary syndrome (according to the Rotterdam criteria<sup>10</sup>); endometriosis and/or uterine myoma requiring treatment; ≥3 miscarriages; clinically significant systemic disease; and clinically significant abnormal hematology, chemistry or urinalysis results at screening.

Nurses (both study and general clinic nurses) involved in the care of patients participating in the study were recruited to complete the nurse questionnaire towards the end of the patient recruitment period; this ensured that they had trained at least one patient. There were no specific inclusion criteria for nurses.

## ***Training***

Nurses were trained by the Merck Serono Key Account Manager, as per normal practice, when the redesigned pen was launched. This training included a formal presentation with a step-by-step guide, diagrams, and information about how the pen had changed from the previous version. If any nurses were unavailable at this time, then the Nurse Unit Manager at IVFAustralia ensured they were trained. During training, nurses could practice with demonstration devices. In addition, nurses could refer to training materials that were retained at the clinics.

Patients were instructed on how to use the redesigned pen by nurses. In addition, patients were provided with written instructions (Patient Information and an Injection Mat).

## ***Assessments and interventions***

At screening, laboratory samples were obtained for routine hematology, chemistry, urinalysis, and hormone level determinations. Blood samples were analyzed locally to assess AMH and early follicular phase FSH levels. During screening (after enrollment), patients were trained by their nurses on how to use the redesigned follitropin alfa pen (GONAL-f®; Prefilled Pen; 300 IU, 450 IU, and 900 IU).

Following a negative pregnancy test result, patients underwent a single ART treatment cycle, started within 2 months following the screening visit. Follitropin alfa was self-administered subcutaneously daily using the redesigned pen. The investigator decided the starting dose of follitropin alfa, which was dosed according to the standard clinical practice (and within the approved label) from stimulation day 1 until the required criterion for recombinant human chorionic gonadotropin (r-hCG) administration was met ( $\geq 3$  follicles,  $\geq 17$  mm). From stimulation day 5 or 6, the dose could be increased or decreased based on the ovarian response of the patient and according to the center's standard practice. Follicular development was monitored according to the center's standard practice by transvaginal ultrasound (US) and/or estradiol ( $E_2$ ) levels. Once r-hCG criterion had been met, a single 250  $\mu\text{g}$  r-hCG injection was administered to induce final oocyte maturation.

Pituitary down-regulation was achieved with either the gonadotropin-releasing hormone (GnRH) agonist long protocol or the GnRH antagonist protocol as per the center's standard protocol. Oocytes were retrieved vaginally under US monitoring 34–38 h after r-hCG administration. Oocyte pick-up, IVF, embryo transfer (ET), and luteal support were performed as per the center's standard practice.

To evaluate compliance with treatment, patients were consulted by the clinic nurse and the daily r-hFSH dose was recorded.

## ***Ease of use***

Patients evaluated various aspects relating to the ease of use of the redesigned r-hFSH (follitropin alfa) injection pen by completing two questionnaires. Following training on how to use the

new pen and before the start of treatment (either during the screening period or the day before starting treatment), patients completed Questionnaire A (Supplementary Figure S1). Questionnaire B (Supplementary Figure S2) was completed by patients on days 5–6 and 7–8 of r-hFSH stimulation, and also at the end of stimulation (within a day of r-hCG administration). Questionnaires were completed independently without clinic personnel involvement; once completed, patients placed them in a dedicated, locked box. The box could only be opened by the study monitor who sent the questionnaires for database entry. Confidentiality was maintained and no responses were known by clinic personnel.

At the end of recruitment, the teaching nurses completed a questionnaire (Questionnaire C; Supplementary Figure S3) on the ease of learning to use the pen and the ease of teaching how to use it.

## ***Safety***

Data on adverse events (AEs) were collected throughout the study. The possible causality, in the investigator's opinion, of an AE in relation to study treatment was also recorded.

A post-treatment, safety follow-up evaluation was performed at the last study visit for all patients who had received rhCG; for non-pregnant patients this evaluation occurred when the pregnancy diagnosis test was conducted (post r-hCG day 15–20), and for pregnant patients this occurred when the US to confirm clinical pregnancy was conducted (post r-hCG day 35–42). Patients who withdrew from the study at any time and received at least one dose of follitropin alfa had their post-treatment safety visit 15–20 days after the last follitropin alfa administration.

## ***Outcomes***

### **Primary endpoint**

The primary endpoint was the proportion of patients rating the r-hFSH (follitropin alfa) injection pen as 'easy' or 'very easy' to use for self-injection based on a user questionnaire (Questionnaire B), which was completed at the final monitoring visit before r-hCG administration.

## **Secondary endpoints**

Secondary endpoints included the proportion of patients rating the redesigned r-hFSH (follitropin alfa) injection pen (Questionnaires A and B) as: easy to learn; easy to use; easy to prepare for injection; easy to deliver the injection; and easy to dispose of after completing the injection. Other secondary endpoints included the proportion of nurses rating the follitropin alfa redesigned pen in a Nurse Questionnaire (Questionnaire C) as easy to learn, easy to use, and easy to teach.

Other (tertiary) endpoints included: total dose of follitropin alfa used; mean daily dose of follitropin alfa used; biochemical pregnancy rate; clinical pregnancy rate; cycle cancellation prior to r-hCG; and the incidence of multiple pregnancies.

Safety endpoints included the incidence and severity of treatment-emergent AEs (TEAEs; according to their relationship to ART treatment in general), including OHSS. The incidences of early onset OHSS (occurring during stimulation and up to 9 days post r-hCG administration and oocyte retrieval) and late-onset OHSS (occurring on or after 10 days post r-hCG administration and oocyte retrieval) were recorded. In addition, injection tolerability was evaluated from the general AE data.

## ***Statistical analysis***

The intent-to-treat (ITT) population was used to summarize and analyze the primary, secondary, and other endpoints. The ITT population was defined as all patients who received at least one dose of follitropin alfa and who had at least one post-baseline efficacy measurement (dose of follitropin alfa or completed questionnaire). The safety population (all patients who received at least one dose of follitropin alfa) was used to evaluate safety data, follitropin alfa dose and the rate of cycle cancellation prior to r-hCG.

All data were made anonymous prior to analysis. Table 1 presents the specific questions used from each of the three questionnaires for the primary and secondary endpoints and the visit at which they were answered. The primary efficacy measure in this study was obtained from Questionnaire B completed at the end of follitropin alfa stimulation. If a patient had not completed

Questionnaire B at this visit, the day 7–8 Questionnaire B data were used. At least 50% of questions required for an efficacy measure were needed to provide a valid estimate. A sensitivity analysis including those results based on <50% of questions was also undertaken. For Questionnaire C, if a nurse had >50% unanswered responses for the questions for an endpoint then these data were not included in the analysis for that endpoint.

The primary and secondary endpoints were presented as a proportion with 95% confidence intervals (CIs). For other endpoints, quantitative variables were summarized by the number of patients (n), mean, standard deviation (SD) and range; qualitative variables were summarized by frequency and percentage of patients; rates were summarized by the numerator, denominator, rate and its 95% CI. Descriptive statistics only were provided for AE data.

## ***Sample size***

A sample size of 100 patients treated for one ART cycle was determined based on the precision of the 95% CI for the primary endpoint (the proportion of patients rating the pen as ‘easy’ or ‘very easy’ to use) as this was a single-arm study. Under this approach, no statement of power was required and  $\alpha = 0.05$  was used as the CI specified is 95%.

A sample size of 100 patients produces a two-sided 95% CI with a width that differs depending on the assumed proportion. For example, if the proportion is 0.50 (or 50%) and  $n = 100$  patients, the 95% CI will be 0.40 to 0.60, a width of 0.2; whereas if the proportion is as high as 0.85 the confidence interval will be 0.77 to 0.91, a width of 0.14.

## ***Changes to the statistical section of the protocol***

Originally, the protocol indicated that the endpoints (e.g. ease of use, ease of learning, ease of preparation) for the follitropin alfa pen would be obtained from a response of ‘easy’ or ‘very easy’; this implied that only one question would be used to assess each endpoint. The questionnaires used contained multiple questions addressing each endpoint; hence, a modification was made to the process used to classify a patient’s response as ‘easy’.

## **Results**

The study was conducted in Australia between 31 March 2011 and 9 February 2012.

### ***Patients***

A total of 100 patients were screened and enrolled in the study. Fourteen patients failed screening (eligibility violation, n = 4; withdrew consent, n = 9; other, n = 1) and 86 attended the pre-scheduled first day of stimulation (Figure 1) and, therefore, received r-hFSH treatment and were included in the safety population. All 86 patients in the safety population were included in the ITT population (n = 86).

Patient demographics and other characteristics are given in Table 2. Some patients had protocol deviations relating to the study inclusion/exclusion criteria; for example, three patients were later discovered to have had more previous ART cycles than stipulated in the eligibility criteria. However, as the inclusion/exclusion deviations were considered not to impact on the primary or secondary endpoints relating to Questionnaire B, no patients were excluded from the analyses for such deviations.

### ***Questionnaire completion***

Questionnaire A was completed by 77/86 patients in the ITT population. Questionnaire B was completed by 55 patients on the last day of follitropin alfa stimulation and by 18 patients on day 7–8 of stimulation. Therefore, responses from 73 patients were used for the overall 'ease-of-use' assessment. However, not every patient responded to every question. A total of 26 nurses completed Questionnaire C.

### ***Ease of use***

### **Primary endpoint**

Of the 72 patients who had completed the overall assessment questions, 66 (91.7% [95% CI 82.7–96.9]) found the pen easy to use overall (Figure 2).

Responses to key questions from Questionnaire B that were used in the primary endpoint are shown in Figure 3.

## **Secondary endpoints**

### *Easy to learn – Questionnaire A*

Responses regarding previous experience showed that the majority (50/86, 65.8%) of patients had never used injections/injectable medications prior to the study. There were 17/86 (22.4%) patients who had used >10 injections/injectable medications within the last 12 months.

Most (70/76, 92.1%) patients strongly agreed or agreed that, overall, it was easy to learn how to use the pen. In addition, 72/76 (93.5%) patients strongly agreed or agreed that easily understandable verbal information was provided, and 70/76 (92.1%) patients were confident about using the pen correctly after training.

### *Easy to use (by visit)*

Figure 4 shows the percentage of patients who classified the pen as easy to use by visit.

At days 5–6 of follitropin alfa stimulation, the pen was classified as easy to use by 64/76 (84.2%) patients. At days 7–8 and at the last day of follitropin alfa stimulation (or within a day of r-hCG stimulation) the pen was classified as easy to use by 62/68 (91.2%) and 50/55 (90.9%) of patients, respectively.

### *Easy to prepare for injection*

At the three visits, the pen was classified as easy to prepare for injection by 83–91% of patients (Figure 4).

### *Easy to deliver the injection*

The proportion of patients who considered that it was easy to deliver an injection using the pen was slightly lower at days 5–6 of follitropin alfa stimulation (78.9%) than at the two later visits (91.2 and 87.3%; Figure 4).

### *Easy to dispose of after completing the injection*

The proportion of patients who considered that it was easy to dispose of the pen was similar at all three visits (82–85%; Figure 4).

### *Sensitivity analysis*

The sensitivity analysis (based on results where <50% of Questionnaire B questions were answered) found only minor differences in percentages compared with the main analysis where at least 50% of questions required for an efficacy measure were needed to provide a valid estimate.

### *Nurses' experience and perceptions*

The nurses had previous ART experience ranging from 4 months to 30 years (mean [SD] 6.1 [6.4] years). Furthermore, 18 (69.2%) nurses were familiar with vials and syringes, 19 (73.1%) with ampules and syringes, 25 (96.2%) with non-returnable pens, and 18 (69.2%) with returnable pens. The mean (SD; range) number of patients trained by a nurse was 5.9 (6.6; 1–25).

Overall, the pen was rated as easy to use by 92.3% (24/26 [95% CI 74.9–99.1]) of nurses. All 26 (100%) nurses rated the pen as easy to learn and easy to teach. In addition, all 26/26 (100%) of the nurses thought the follitropin alfa pen was: 'very easy' or 'easy' to learn; 'very simple' or 'simple' to prepare for first use; and 'very easy' or 'easy' to teach to patients. Furthermore, 25/26 (96.2%) nurses found it 'very simple' or 'simple' to dial the correct dose. However, only 5/26 (19.2%) found it easy to read the dosing scale.

All 26 (100%) nurses experienced 'no' or 'very little' confusion while using the pen, were 'very satisfied' or 'satisfied' with the time to administer and the time to teach, were 'confident' that the dose had been injected, found the patient information and patient support material 'very useful'

or 'useful', and found the patient information and patient support material 'not confusing at all' or had 'no opinion'.

In addition, compared with other injection procedures, 22/26 (84.6%) nurses found 'much less' or 'less' potential for errors during setting the dose, and 19/25 (76.0%) found 'much less' or 'less' potential for errors during preparation for the injection.

## **Other endpoints**

The mean (SD) of follitropin alfa used was 2593 (1540.8) IU for the total dose and 233 (99.1) IU for the daily dose (safety population).

In total, 25/86 (29% [95% CI 20–40]) patients had a biochemical pregnancy confirmed by serum  $\beta$ -hCG pregnancy test (safety population). In those patients who underwent ET (n = 67), this equated to a 37% (95% CI 26–50) biochemical pregnancy rate. All biochemical pregnancies were confirmed as clinical pregnancies by US (i.e. clinical pregnancy and biochemical pregnancy rates were the same). Therefore, the clinical pregnancy rate per patient and per ET was 37% (95% CI 26–50%).

Two women had preclinical miscarriages (defined as a spontaneous cessation of a biochemical pregnancy; no fetal sac/heart detected by US on post r-hCG day 35–42). The treatment cycle was cancelled prior to r-hCG administration in three patients (safety population). In addition, four women had multiple pregnancies.

## **Compliance**

No doses of follitropin alfa were reportedly missed by any patient.

## **Safety**

A total of 30 patients reported at least one TEAE. There were two patients who reported a serious TEAE: one ectopic pregnancy requiring hospitalization, dilation and curettage, and one case of urinary retention requiring hospitalization. There were no deaths during the study.

Sixteen (16 [19%]) patients had at least one event of OHSS. In total there were 26 OHSS events reported: none were severe, six events were moderate (reported by 5 [6%] patients) and 20 events were mild (reported by 13 [15%] patients). Of the 26 OHSS events reported, one occurred at stimulation day 5–6, 3 at stimulation day 7–8, four at oocyte pick up, 13 at embryo transfer, and five at study end. There were 10 patients who experienced one OHSS event; three patients experienced two OHSS events, two patients experienced three OHSS events and one patient experienced four OHSS events. At least one OHSS event classified as early onset was reported by 14 patients and five patients had at least one OHSS event classified as late onset.

There were no incidents recorded of injection intolerability (as assessed from the general AE summaries).

## Discussion

Pen devices for the self-injection of medicines aim to provide patients with a convenient and easy-to-use option for self-medication. The design of any new pen device should facilitate accurate self-administration of medication, while also providing ease-of-use benefits. This single-arm, observational study demonstrated that, overall, the majority (92%) of patients found the redesigned follitropin alfa pen easy to use. Furthermore, although a large proportion of patients had never used an injection or injectable device previously, most (81%) patients found that it was easy to learn how to use the pen. Importantly, a high proportion of patients found that the verbal information provided was easy to understand and were confident about using the pen following training. Therefore, clinicians can be reassured that their patients should be able to use the pen easily and confidently.

In the present study, over time, slightly more patients rated the pen as easy to use (90.9% at the end of follitropin alfa stimulation [within a day of r-hCG administration] compared with 84.2% at days 5–6). This finding suggests that increased familiarity with the pen may make it easier to use. However, as this was observed for only a small number of patients, it does not suggest a need for extended or increased training of patients prior to their first use of the pen.

Evaluation of patients' use of a newly designed injection pen is important as an assessment of safety. Ease of preparation for injection and ease of delivery of an injection assess how well patients can self-administer the r-hFSH dose. Furthermore, evaluation of the ART nurses'

perceptions of the pen – in terms of dialing the correct dose, confusion while using the pen, potential for errors when setting the dose, and potential for errors during preparation for the injection – also provides valuable insights into aspects of safety.

The findings from the present study indicate that there are no major concerns with the redesigned pen in terms of the above issues relating to safety. However, only 19.2% of nurses found it easy to read the dosing scale on the pen, an issue that may merit further review.

The redesigned follitropin alfa pen is part of a family of pens with a common design concept and similar operating system.<sup>11</sup> These pens were developed to simplify the process of gonadotropin self-administration,<sup>11</sup> for both the patient and those who teach patients this method. The redesigned pen has enhanced features, such as graduated markings on the cartridge reservoir showing approximate units remaining and that the dose can be dialed up and down,<sup>6</sup> In addition, the dosing accuracy of the pen has been confirmed.<sup>6</sup>

Two initial studies exploring the use of the follitropin alfa pen by patients and nurses were conducted using simulated injections (and so were not evaluating injections during an actual ART cycle). In the first, a market research study in infertile patients and infertility nurses, the authors reported that the redesigned follitropin alfa pen was easy to learn, easy to teach how to use, and well accepted.<sup>12</sup> The second, a non-interventional usability study, found no major concerns regarding the risk of misuse or dosing errors, and no unexpected operational risks,<sup>13</sup> suggesting that correct dosage and proper use of the follitropin alfa pen device by the patient will be likely in practice.

The rate of clinical pregnancies per ET (37%) reported here was as expected and is consistent with previously published data. For example, clinical pregnancy rates of 36–41% were reported in an Australian study in women receiving r-hFSH for COS.<sup>14</sup>

In this study, r-hFSH injections were generally well tolerated; there were no reports of injection intolerability. The incidence of OHSS events reported here was higher than would normally be expected with r-hFSH treatment for COS. A possible explanation for this is that relatively high r-hFSH doses were utilized: the mean daily dose was 233 IU (all r-hFSH doses were determined by the investigator and daily doses could have been higher than the recommended initial 150 – 225 IU dose) and the mean total dose of r-hFSH was 2593 IU, which is higher than that observed in a previous study of r-hFSH for COS.<sup>15</sup>

The strengths of the study include the population size, which allowed the detailed perceptions of a relatively large group of patients to be evaluated, and the use of the center's standard guidelines for protocols and procedures, thereby reflecting real-life clinical practice. Furthermore, the study evaluated both nurse and patient perceptions; it is important to investigate the opinions of both the user (patients) and those teaching the user (ART nurses) so that a holistic view of the redesigned pen device may be obtained.

The limitations of the study include that it was an open-label, observational study and that the findings are limited to the population studied. The lack of a comparator arm is an additional limitation; however, the aim of the study was to evaluate Australian patients' perceptions of the ease of use of the redesigned pen and not to compare injection devices. Another possible limitation is that data were obtained from women undergoing their first ART cycle (57% of enrolled patients had not had a previous ART cycle) as well as women who had experienced previous ART cycles. Although this may have introduced bias, as some patients had experience of gonadotropin injections used for ART, it also reflects the real-life clinical situation where patients present with different infertility histories. In addition, another potential limitation is that the three questionnaires used in this study have not been previously validated.

## **Conclusion**

Overall, this single-arm, observational study found that COS using the redesigned pen (follitropin alfa, GONAL-f® Prefilled Pen) was effective and well tolerated. Furthermore, patients had a high level of acceptance for the redesigned pen, with most patients finding it 'easy' or 'very easy' to use during COS for ART. In addition, most ART nurses found the pen 'easy' or 'very easy' to teach. An injection device that is both easy to use and easy to teach provides a useful treatment option for both patients and healthcare professionals.

**Table 1.** Summary of the ease-of-use questionnaires and questions used to evaluate the primary and secondary endpoints

Endpoint	Questionnaire	Questions	Study visits used to assess endpoint
Primary			
The proportion of patients rating the pen as easy to use at end of stimulation-phase visit	B	1, 2, 4–7, 9, 10,13–19	End of stimulation visit <sup>a</sup>
Secondary			
The proportion of patients rating the pen as easy to:			
Use	B	1, 2, 4–7, 9, 10,13–19	3, 4, 5 <sup>b</sup>
Learn	A	1–7	Stimulation day 1
Prepare for injection	B	7, 14, 15	3, 4, 5 <sup>b</sup>
Deliver injection	B	1, 2, 4, 5, 9–11, 16, 17	3, 4, 5 <sup>b</sup>
Dispose of after injection	B	18, 19	3, 4, 5 <sup>b</sup>
The proportion of nurses rating the pen as easy to:			
Use	C	3–16	End of recruitment
Learn	C	3	End of recruitment
Teach	C	5	End of recruitment

**Notes:** <sup>a</sup>Visit 5 (end of follitropin alfa stimulation/r-hCG administration); however, if data were unavailable for this time point, then stimulation days 7–8 data were used. <sup>b</sup>Visit 3 was on follitropin alfa stimulation days 5–6; visit 4 was on stimulation days 7–8; and visit 5 was the end of stimulation/r-hCG administration visit.

**Abbreviation:** r-hCG, recombinant human chorionic gonadotropin.

**Table 2** Patient demographics and other characteristics (Intent-to-treat population)

		Intent-to-treat population (N = 86)
Age (years)	Mean (SD)	35.8 (3.6)
	Range	26–42
Race (%)	Caucasian	82.6
	Asian	14.0
	Other	3.5
BMI (kg/m <sup>2</sup> ) <sup>a</sup>	Mean (SD)	23.2 (3.9)
	Range	17–35
Baseline FSH (IU/L) <sup>b</sup>	Mean (SD)	7.4 (2.5)
	Range	0.9–12.4
Baseline AMH (pmol/L) <sup>c</sup>	Mean (SD)	11.8 (10.0)
	Range	0.4–50.0
Number of previous ART cycles (% of patients)	0	54.7
	1	22.1
	2	17.4
	3	1.2
	4	1.2
	5–7	3.5

**Notes:** <sup>a</sup>Data are reported for 84 patients. <sup>b</sup>Data are reported for 68 patients. <sup>c</sup>Data are reported for 82 patients.

**Abbreviations:** AMH, anti-Müllerian hormone; ART, assisted reproductive technology; BMI, body mass index; FSH, follicle-stimulating hormone; SD, standard deviation.

<<Note to editor: submit figures as TIFFs>>

**Figure 1** Patient disposition

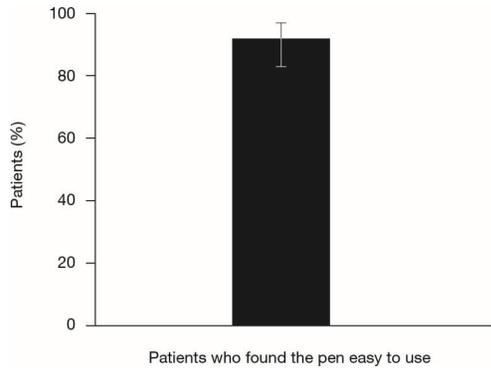

**Notes:** <sup>a</sup>One patient had an incorrect trigger injection time; this meant that no oocyte pick-up was performed.

**Abbreviations:** OHSS, ovarian hyperstimulation syndrome; r-hCG, recombinant human chorionic gonadotropin.

**Figure 2** Proportion of patients who found the follitropin alfa pen easy to use (primary endpoint)

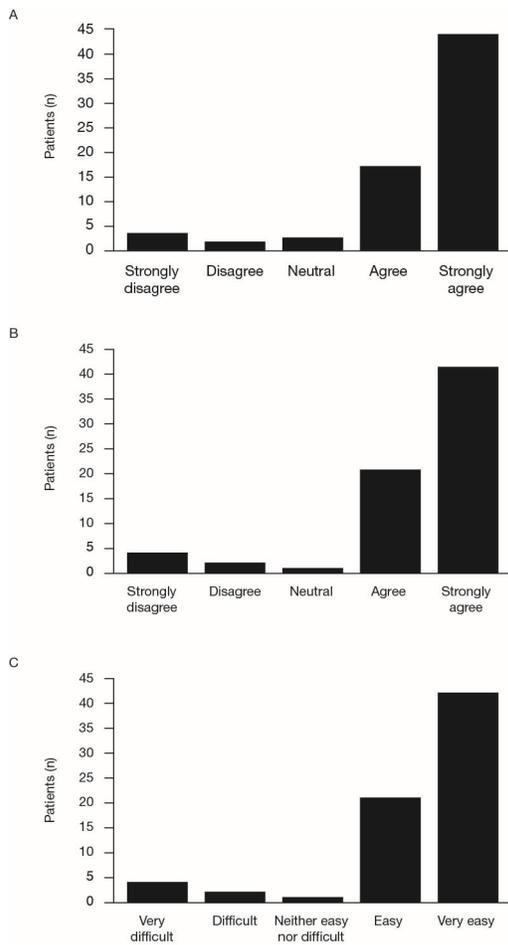

(N = 73)

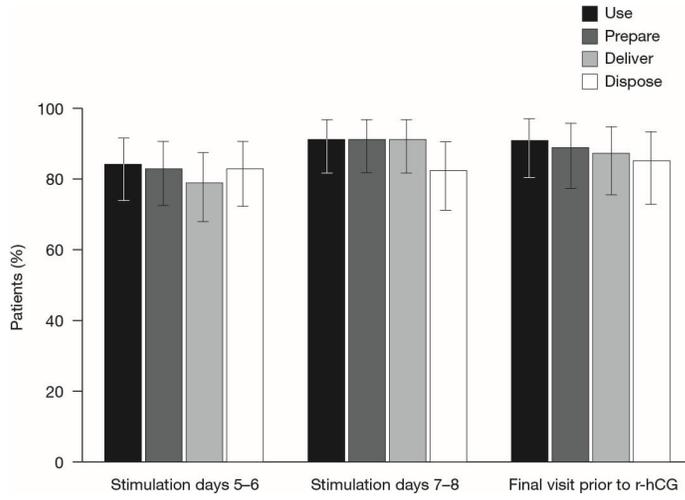

**Note:** Error bars represent 95% confidence intervals.

**Figure 3** Questionnaire B results – key questions to determine follitropin alfa pen ease of use (primary endpoint)

A) Question 1 ‘The GONAL-f pen allows me to know for sure when the injection has been completed’ (n = 76); B) Question 10 ‘I am confident that I am injecting a complete dose of medication with the GONAL-f pen’ (n = 76); C) Question 15 ‘Overall, how do you rate your experience with Setting (dialing in) the right dosage’ (n = 76).

**Figure 4** Proportion of patients rating the follitropin alfa pen (easy to use/prepare/deliver/dispose) by visit (intent-to-treat population)

**Note:** Error bars represent 95% confidence intervals

**Abbreviation:** r-hCG, recombinant human chorionic gonadotropin.

## Additional files

### Supplementary Figure S1 Questionnaire A

The following questions ask about the GONAL-f® Prefilled Pen injection device you will be using as part of the research study.

Please choose the most appropriate response.

**Tick only one box per question.**

		Strongly disagree	Disagree	Neither agree nor disagree	Agree	Strongly agree
	My trainer provided easily understandable verbal information about how to use the Gonal-f Pen					
	My trainer provided practical information on how to use the Gonal-f Pen.					
	After completing my training I am confident that I can use the Gonal-f Pen correctly.					
	After completing my training I am confident that I can set the Gonal-f Pen correctly to deliver the dosage of medication that my doctor prescribes.					
5.	The instruction materials provided to me (e.g. Patient Information, Injection Mat & DVD) were clear and helped me understand how to use the Gonal-f Pen correctly.					
6.	I was able to follow the instructions with little or no assistance from others.					
7.	Overall, it was easy to learn how to use the Gonal-f Pen.					

8. Please select one of the answers below which most closely describes your previous experience with injections/injectable medications:

<input type="checkbox"/>	I have never used injectable medications or performed self-injection for any reason.
<input type="checkbox"/>	I have at some point in the past used injectable medication but not on a regular basis (less than 10 injections).

	I have in the past (more than 12 months ago) self-administered injectable medication(s) on a regular basis (more than 10 total injections).
	I currently or within the last 12 months regularly (more than 10 total injections) self-administered injectable medication(s).

**Supplementary Figure S2** Questionnaire B (days 5–6, days 7–8 and Visit 5 [end of stimulation/r-hCG administration])

The following questions ask about the GONAL-f® Prefilled Pen injection device you have been using as part of the research study. You should answer these questions based on your experience with the injection device you have been using.

Thank you for your time in completing this questionnaire.

**Please tick only one box per question.**

		Strongly disagree	Disagree	Neither agree nor disagree	Agree	Strongly agree
	The Gonal-f Pen allows me to know for sure when the injection has been completed.					
	The Gonal-f Pen makes the injection simple.					
	I would feel comfortable using the Gonal-f Pen away from home.					
	The Gonal-f Pen allows for easy access to the appropriate injection sites.					
	The Gonal-f Pen helps me self-administer my injections.					
	The Gonal-f Pen makes it easy for me to take my injection on time (when I am supposed to).					
	The ready-to-use format is a key benefit of the Gonal-f Pen.					
	It was convenient to store the Gonal-f Pen.					
	With the Gonal-f Pen I am confident that I performed the injection correctly.					
	I am confident that I am injecting a complete dose of medication with the Gonal-f Pen.					
	I experience little or no discomfort giving myself injections with the Gonal-f Pen.					
	The size and appearance of the Gonal-f Pen allows me to use it away from home.					

Overall, how do you rate your experience with:

	Very difficult	Difficult	Neither easy nor difficult	Easy	Very easy
Overall using the injection device.					
Attaching the needle to the injection device.					
Setting (dialing in) the right dosage.					
Pushing the button to deliver the injection.					
Holding the device during the injection.					
Removing the needle from the injection device.					
Disposal of the needles and supplies.					

	Never	Sometimes	Often	Always
How often were you able to administer the full injection with the device?				

	Extremely inconvenient	Somewhat inconvenient	Neutral / No opinion	Somewhat convenient	Extremely convenient
How would you rate the convenience of this device?					

	Extremely unreliable	Somewhat unreliable	Neutral / No opinion	Somewhat reliable	Extremely reliable
How reliable was the injection device?					

What is the most important benefit of the new device to you?
Overall convenience.
Saves time.
Ease of carrying and using while travelling.
Ease of carrying and using at all times.
Other (specify): _____
Neutral / No Opinion

### Supplementary Figure S3 Questionnaire C

Thank you for your time in completing this questionnaire.

- a) Number of years as an IVF/ART nurse \_\_\_\_\_  
b) Number of study participants you have trained on the Gonal-f Prefilled Pen \_\_\_\_\_

**Please tick only one box, unless otherwise indicated.**

1. Which types of injections are you most familiar with? (tick all that apply)  
Vials and syringe  
Ampoules and syringe  
Pre-filled, ready-for-use, non-returnable pen  
Returnable pen with cartridges to be inserted  
Other (specify) \_\_\_\_\_
2. What type of injections do you generally prefer?  
Vials and syringe  
Ampoules and syringe  
Pre-filled, ready-for-use, non-returnable pen  
Returnable pen with cartridges to be inserted  
Other (specify) \_\_\_\_\_
3. How easy or difficult was it for you to learn to use the pen?  
Very difficult    Difficult    No opinion    Easy    Very easy
4. How simple or difficult was it to prepare the Gonal-f pen for its first use?  
Very difficult    Difficult    No opinion    Simple    Very simple
5. How easy or difficult was it teaching patients how to use the Gonal-f pen?  
Very difficult    Difficult    No opinion    Easy    Very easy
6. How simple or difficult was it to dial the correct dose?  
Very difficult    Difficult    No opinion    Simple    Very simple
7. How easy or difficult is it to read the dosing scale?  
Very difficult    Difficult    No opinion    Easy    Very easy
8. Did you experience any confusion when using the pen?  
A lot of confusion    Some confusion    No opinion  
Very little confusion    No confusion
9. How satisfied are you with the time it takes to use the pen to administer an injection?  
Completely dissatisfied    Not satisfied    No opinion    Satisfied    Very satisfied

10. How satisfied are you with the time it takes teaching patients how to use the Gonal-f pen?  
Completely dissatisfied Not satisfied No opinion Satisfied Very satisfied
11. What was the potential for making errors during setting the dose compared with other injection procedures?  
Much more More Same Less Much less
12. What was the potential for making errors during preparing for the injection, compared with other injection procedures?  
Much more More Same Less Much less
13. How confident do you feel that the actual prescribed dose has been injected?  
Very unconfident Unconfident No opinion Confident Very Confident
14. How easy or difficult do you feel it is to manage an incomplete prescribed dose?  
Very difficult Difficult No opinion Easy Very easy  
N/A
15. How easy or difficult do you feel it is to remove an air bubble if one is present?  
Very difficult Difficult No opinion Easy Very easy  
N/A
16. How easy or difficult was it teaching patients how to change the dose over the phone?  
Very difficult Difficult No opinion Easy Very easy  
N/A
17. How useful did you find the patient Information for Use (or patient leaflet) provided with the pen?  
Useless Not very useful Useful Very useful  
N/A
18. How confusing did you find the patient Information for Use (or patient leaflet) provided with the pen?  
Very confusing Slightly confusing No opinion Not confusing at all  
N/A
19. How useful did you find the patient support materials (including the injection mat and DVD) provided with the pen?  
Useless Not very useful No opinion Useful Very useful  
N/A
20. How confusing did you find the patient support materials (including the injection mat and DVD) provided with the pen?  
Very confusing Slightly confusing Not confusing at all No opinion  
N/A
